

The Art of Regenerative Medicine

The latest innovations of Anti-Aging Technology

“The traditional definition of beauty—in the eye of the beholder—is rapidly expanding to include the innermost health and functionality of our bodies, unseen by any beholder” says Dr. Steven Victor, one of New York’s leading regenerative dermatologists.

Anti-aging approaches historically focused on facial features because there were limited options beyond diet and exercise, that addressed changes to our bodies. Regenerative medicine is remodeling our thoughts on joints, metabolism, flexibility, immunity and energy as we age. The curative capabilities of our bodies can now be harnessed to address impacts from the life events that age us from the inside out.

Science and technology are combining in new and exciting ways to stimulate healing. Stromal vascular fraction cells/stem cells, taken from bone marrow and blood vessels, act as the body’s unique repair system. With technology, these reparative cells can be lipoaspirated by ReGen Medical and further engaged as a highly adaptable cellular product that targets aging, injury and overall damage at the cellular level.

“Beauty is having a high-functioning body that repairs, restores and improves our quality of life—while helping us look and feel younger. We’re proving that beauty is far more than skin deep—and we’re granting immediate access!” ♦
